PROFESSIONAL OVERVIEW

Enterprise Test Management & Automation

Bridging UAT governance, international coordination and hands-on engineering

SAP S/4HANA Finance • Jira/Xray • Python & REST APIs • Reporting Automation

7,000+

Reusable master test cases under repository governance

22

Finance Product Teams across enterprise testing

400+

Test Plans and Test Executions in the testing environment

UAT & Regression

Automation Hub

International Rollouts

Stakeholder Reporting

Available from January 2027 • Munich preferred • Open to relocation in Germany

From market scope to management visibility

01	**Scope preparation**	Rollout inputs → reusable test-case mapping → draft market scope
02	**Business validation**	Finance Product Teams and markets confirm relevance; gaps identified
03	**Execution readiness**	Test-case quality, tester coordination, Jira/Xray plans and executions
04	**UAT monitoring**	Planned vs actual progress, statuses, defects, evidence and blockers
05	**Reporting & follow-up**	15-page KPI package, workstream risks and stakeholder actions

Decision rights remain with the relevant business and programme stakeholders; Test Management coordinates readiness, execution control and reporting.

COLLABORATION MODEL

Connecting central governance and market execution

Rollout & market stakeholders

Provide rollout inputs, market priorities, tester availability and business acceptance decisions.

Central Test Management

Coordinates scope mapping, repository standards, Jira/Xray readiness, execution monitoring and KPI reporting.

Finance Product Teams

Validate business relevance, identify GAP scenarios and support test-case quality and issue resolution.

My contribution Technical ownership of testing-specific Jira/Xray configuration, automation and reporting — combined with cross-team UAT coordination.

Multiple regional rollout streams across completed testing, ongoing execution and preparation phases.

15-page automated UAT KPI reporting framework

Four essential views within one consolidated reporting package

01 Overall test status

Planned vs actual execution, test statuses and changing scope

02 Failure rates by workstream

Where unsuccessful results are concentrated

03 Defect evolution

Open defects, priorities and closure trends

04 Execution by workstream

Planned, executed, remaining, pass/fail and blockers

Jira/Xray data → Transformation & KPI logic → Automated report → Confluence → Stakeholder review

Illustrative reporting structure only; no client screenshots or operational data included.

Modernizing repetitive Test Management workflows

INPUT

Jira/Xray data
Filters & test assets

→

PROCESS

Python / REST APIs
Power Query / VBA

→

APPLICATION

FastAPI + React
SQLite

→

OUTPUT

Dashboards, plans
Executions & reports

Automation Hub

Automates creation and configuration of Test Plans, Test Executions, test cases, filters, dashboards and KPI gadgets.

Reporting transformation

Progressed from Excel-based preparation to Python/API/SQLite-supported automated KPI reporting and publication.

Supporting engineering: GitHub Actions, self-hosted runners, Playwright and AI knowledge assistants.

AI-ASSISTED DELIVERY

Applying AI across engineering and Test Management

Practical AI use across daily delivery — from development to communication

Python & API development

AI-assisted code drafting, refactoring and workflow prototyping.

AI knowledge agents

Configured knowledge assistants for Test Management and programme information.

Debugging & quality

Error analysis, troubleshooting and Playwright test-script drafting.

GitHub Copilot

In-editor coding support for faster iteration and development.

Business communication

Drafting and refining presentations, emails and project timelines.

Repository & CI workflows

GitHub repositories, Actions and self-hosted runners for automation.

NEXT: AZURE CLOUD Exploring Azure-based orchestration of scheduled KPI report refreshes with GitHub Actions and runners — planned, not deployed.

AI supports delivery; testing decisions, code review and information handling remain human-controlled.

BUSINESS VALUE

Governance clarity backed by technical delivery

Testing transparency

Consolidated progress, workstream performance and defect intelligence for stakeholder discussions.

Execution coordination

Structured scope reviews, test readiness, evidence follow-up and market-level alignment.

Repeatable governance

Repository standards, Jira/Xray configuration and consistent management reporting.

Automation enablement

Reduced repetitive administrative work through reusable scripts, APIs and a centralized automation hub.
